
DANIEL COOMBS, University of British Columbia
Real-time modelling of the Coronavirus epidemic

The COVID-19 global pandemic has led to unprecedented interest in mathematical modelling as a tool to understand the dynamics of disease spread and predict the impact of public health interventions. I will talk about how different kinds of mathematical and statistical tools have been used to build our understanding of different aspects of the epidemic as it has progressed, with particular reference to the evolving situations in British Columbia, and in Canada as a whole.
