T-equivariant oriented cohomology of flag varieties

In this talk I will introduce a construction of T -equivariant oriented cohomology of flag varieties. This construction uses only the algebraic properties. More precisely, I will introduce the formal group algebra and the formal affine Demazure algebra. The latter is constructed by generators and relations, and its dual gives the $h_T(G/B)$, where h is an algebraic oriented cohomology in the sense of Levine-Morel. If time permits, I will also mention some result about $h_T(G/P)$.
